

Selective Disclosure, Cross Jurisdiction

*A Gaia-X compliance extension that proves your
business is registered with your country's tax
authority without revealing which company you
are*

Cross-border B2B has a privacy / verification trade-off

- To trade in **Gaia-X dataspace**s, you must prove you're a real, regulated business.
- Today's verification = hand over your full registration record. Name, status, tax class, dissolution date, the works
- Counterparty sees everything. Even when they only need to know "still active."
- Every cross-border deal exposes more than it should.

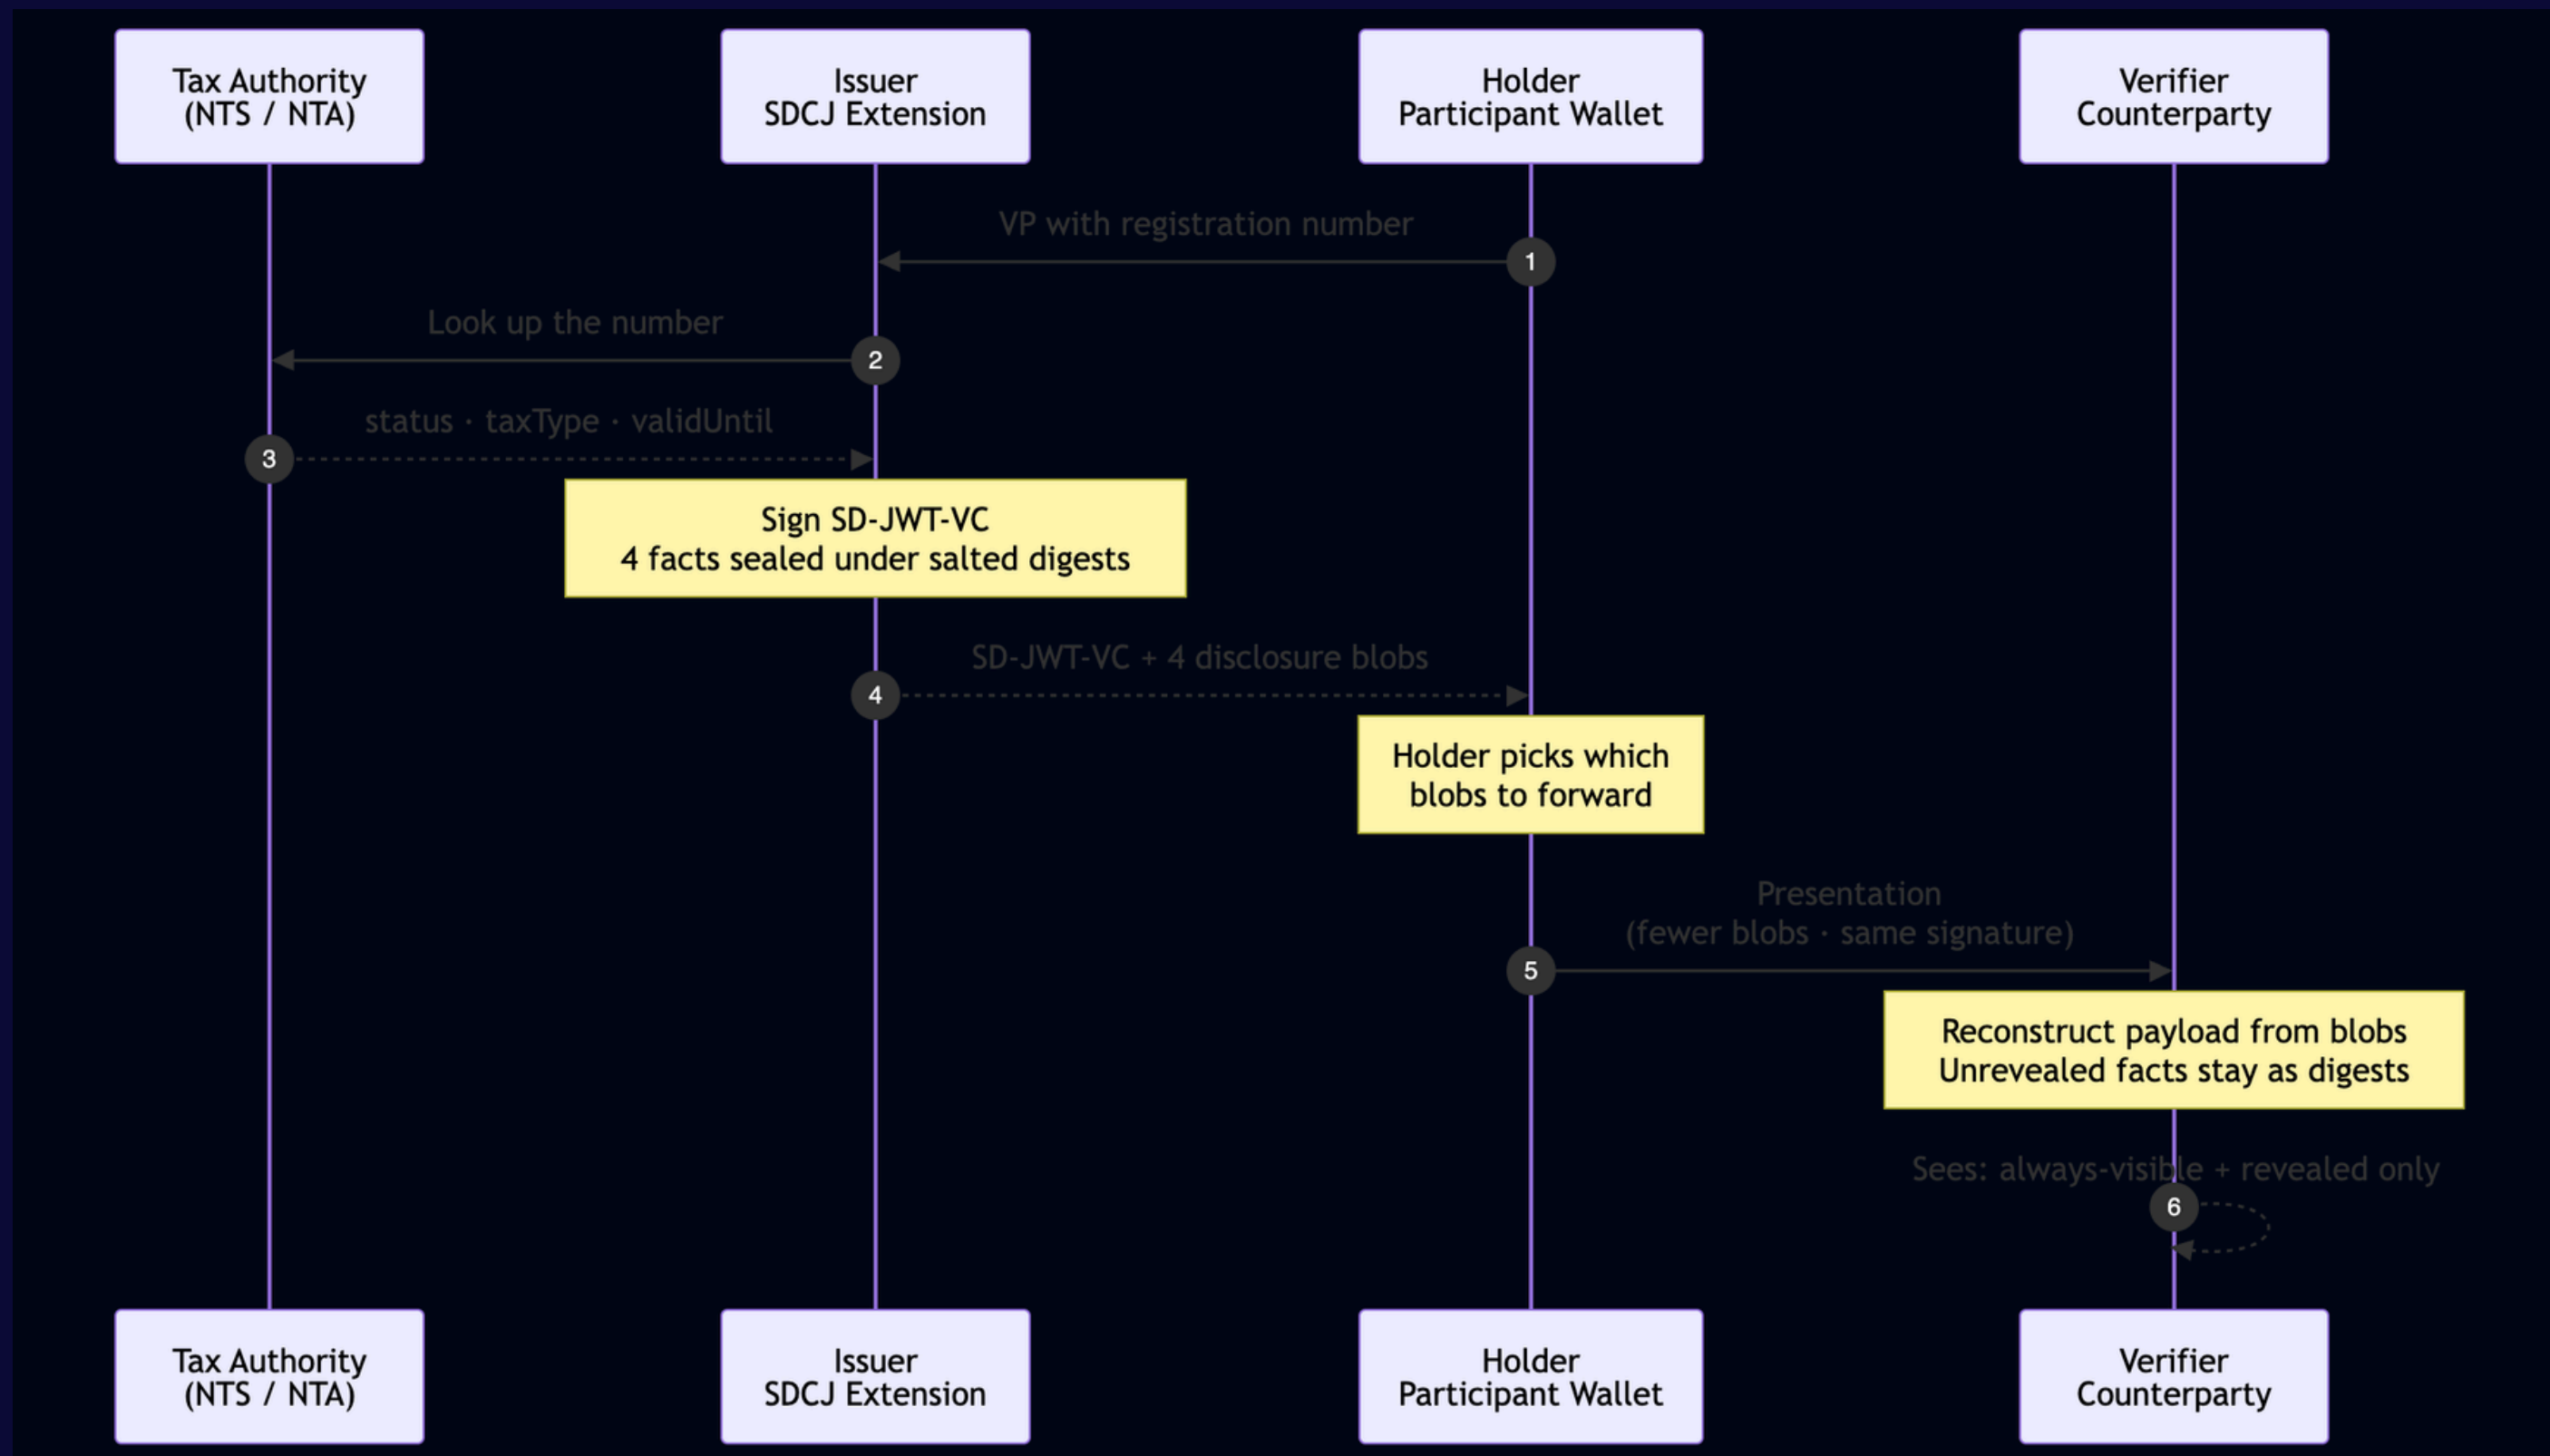

The fact of verification \neq the data that was verified

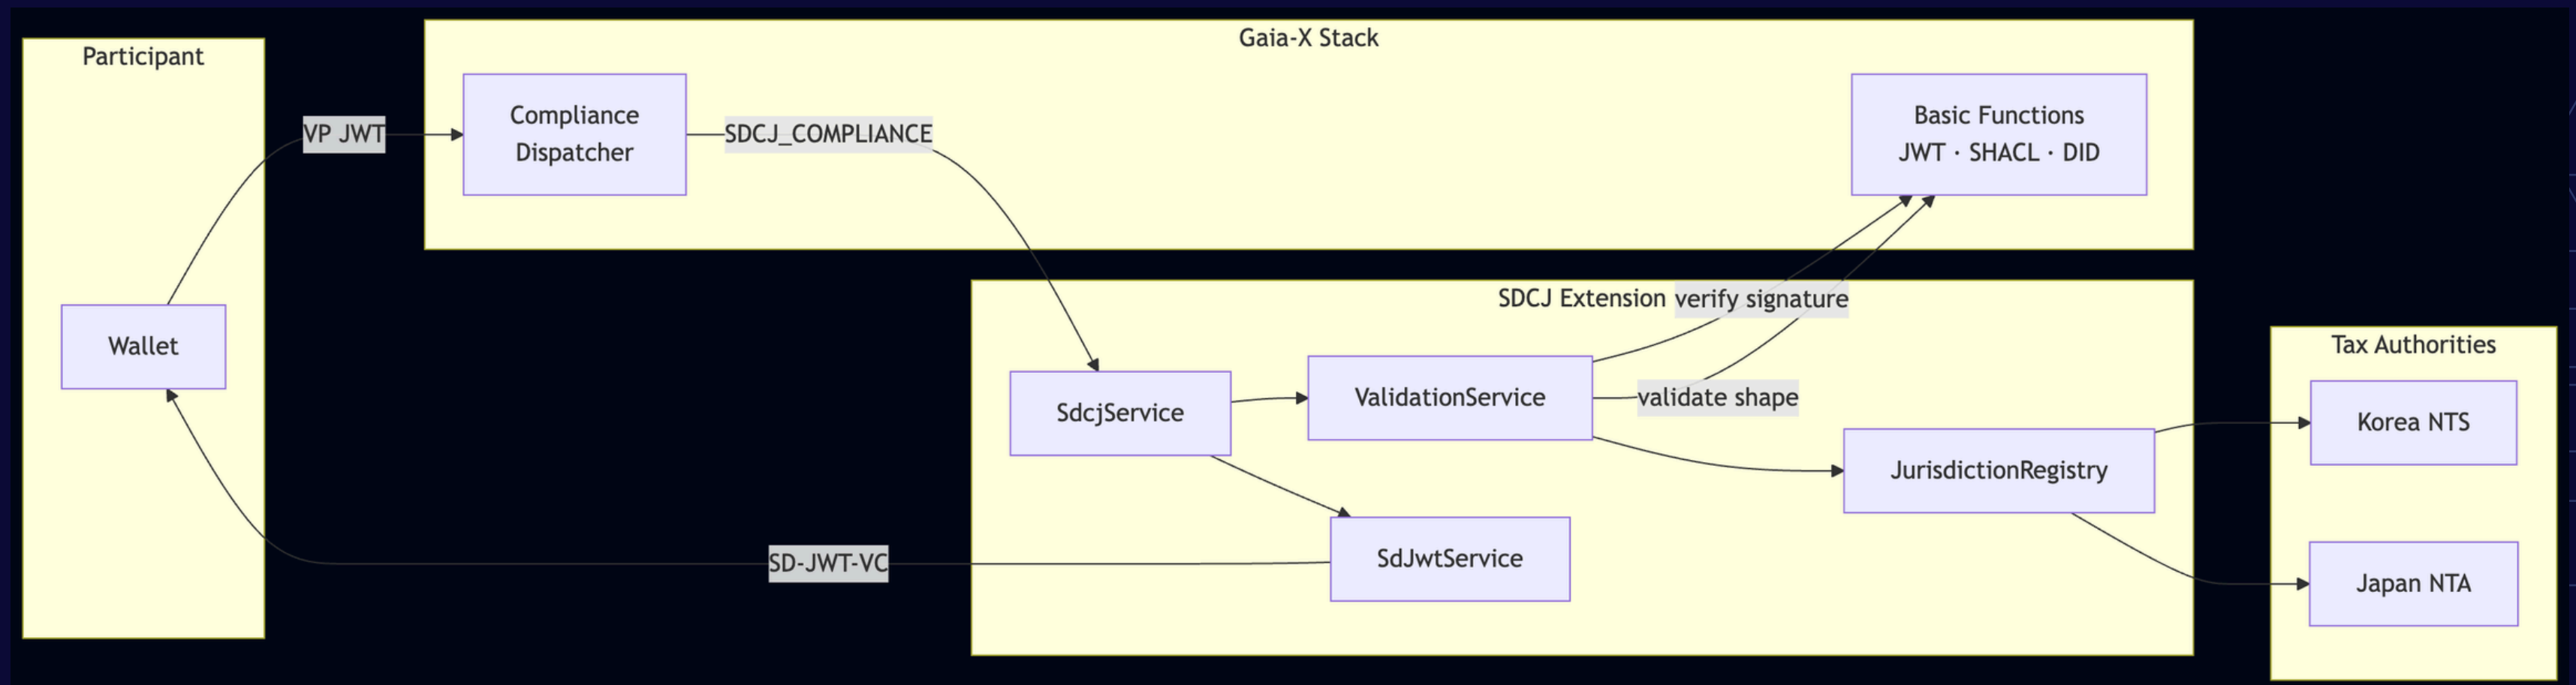

- A tax authority confirms your number is active. That's the fact
- The verifier needs that fact. Not the underlying record.
- SD-JWT-VC lets you separate "I was verified" from "here's what was checked."

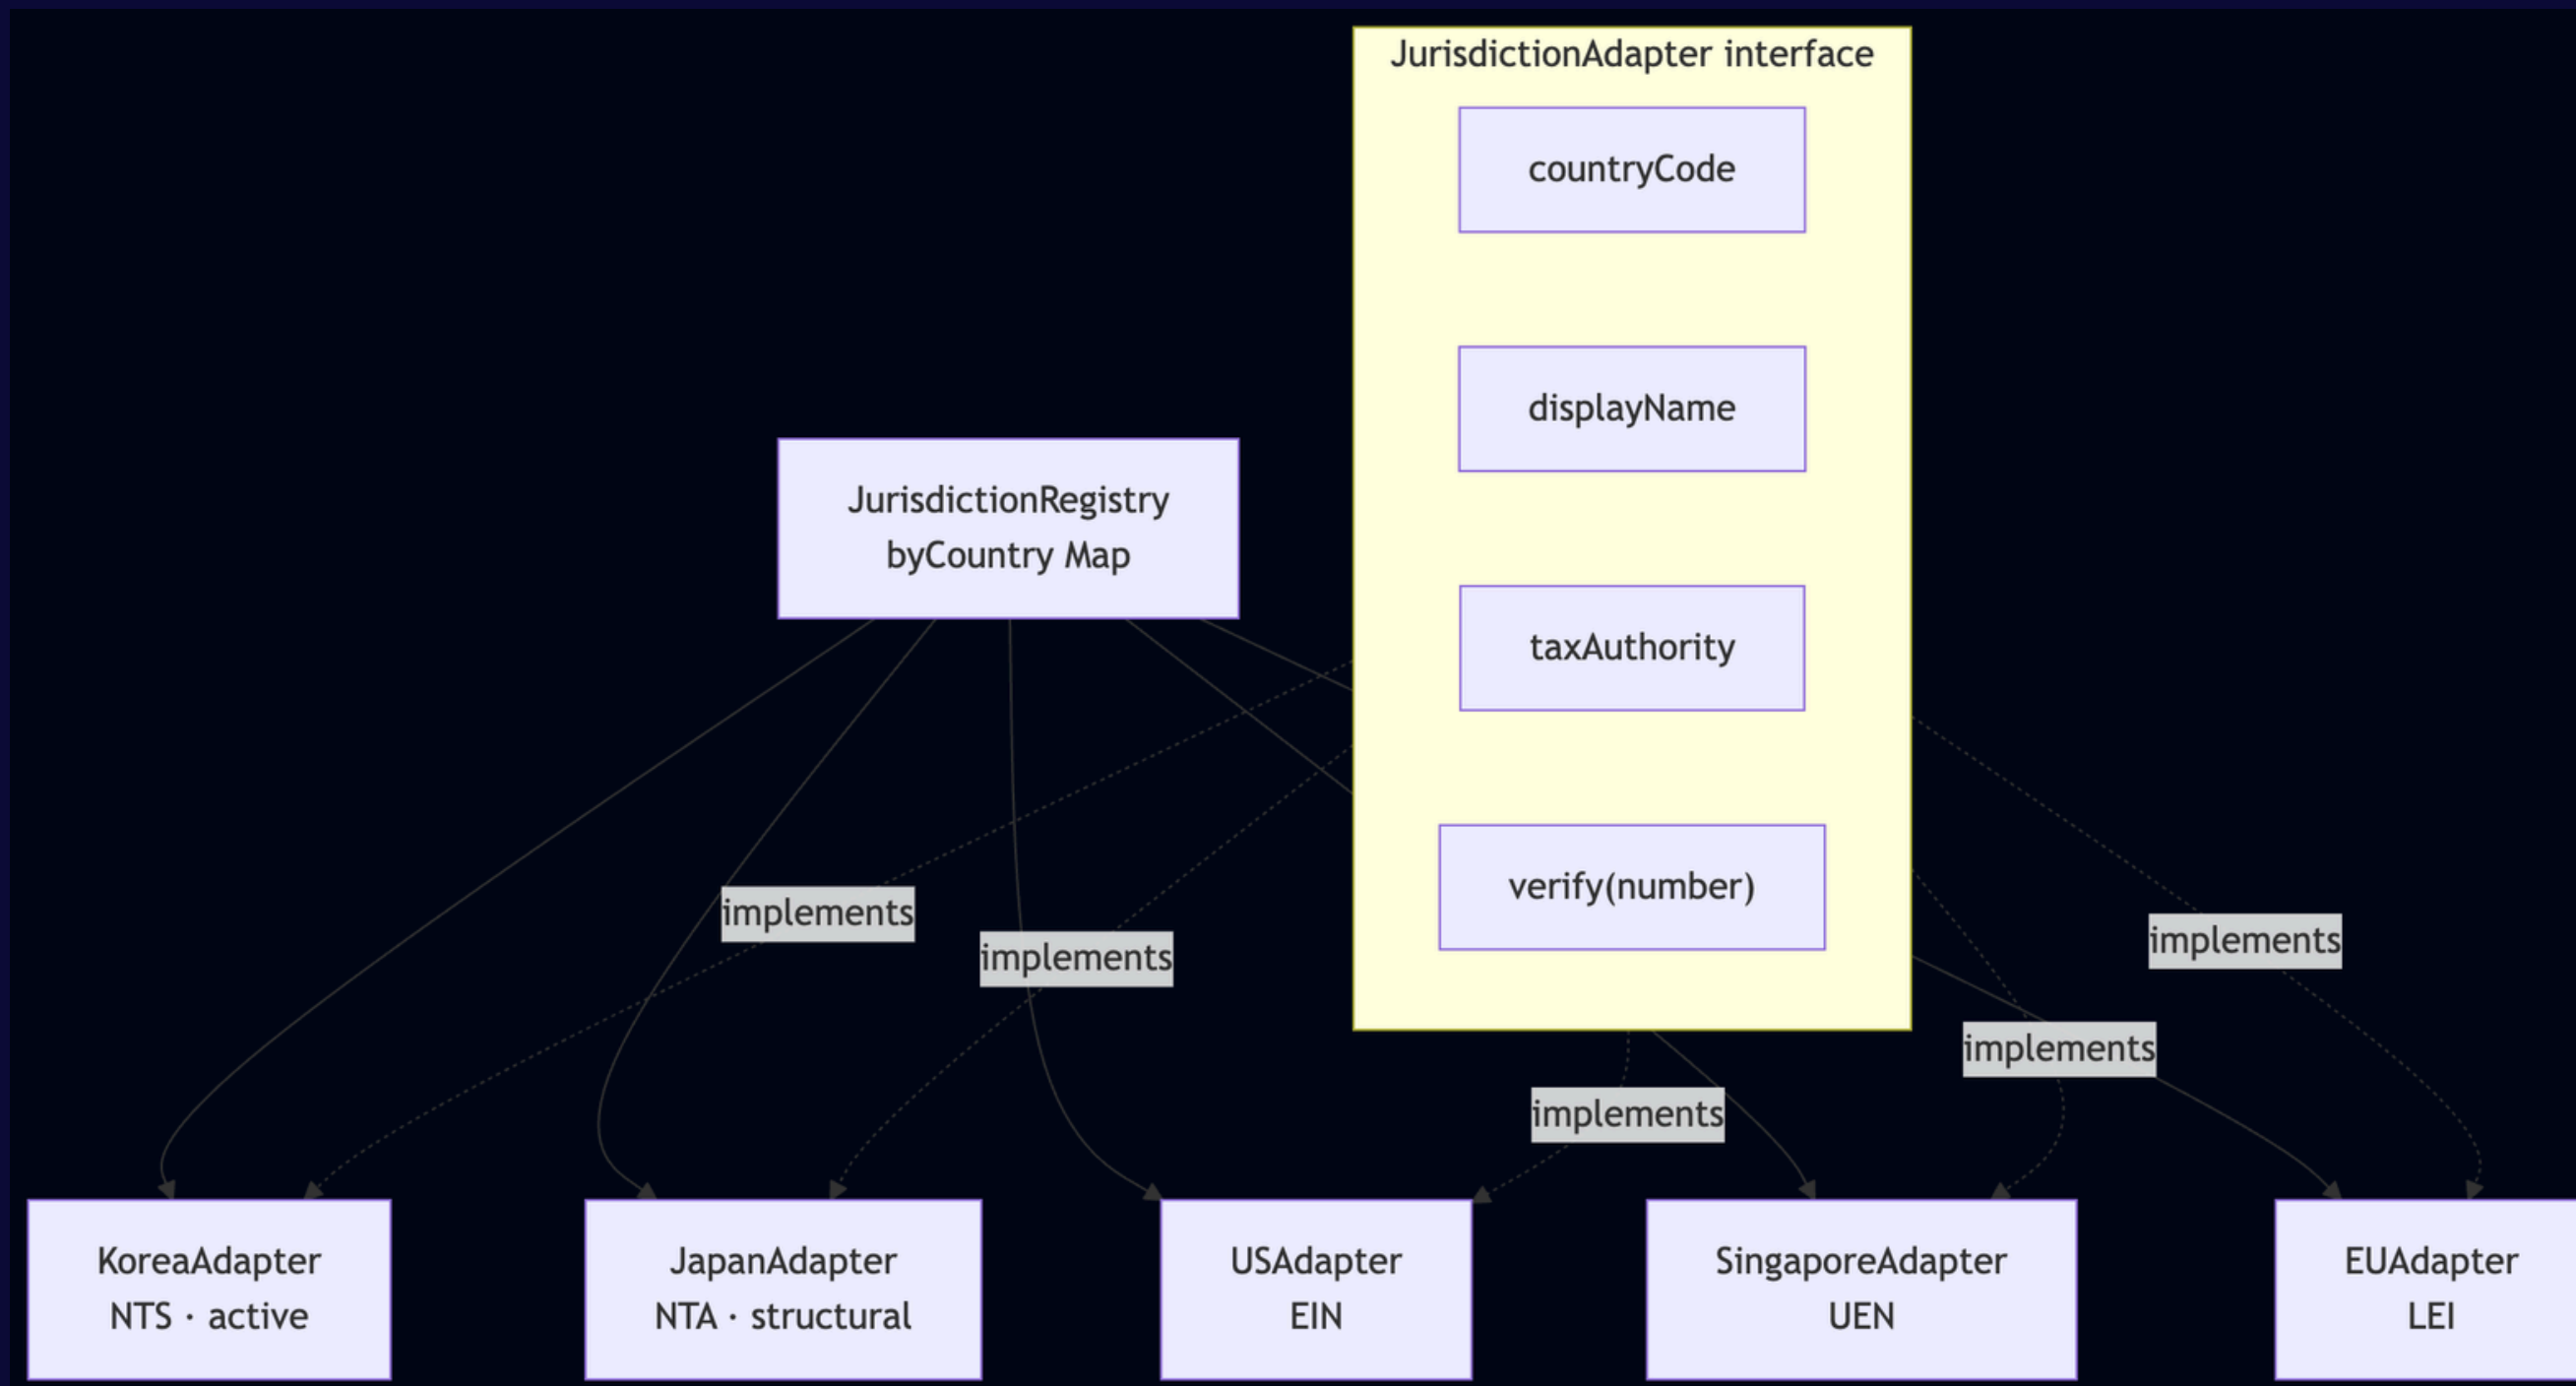

Issuer → Holder → Verifier

Built as a proper Gaia-X Danube extension

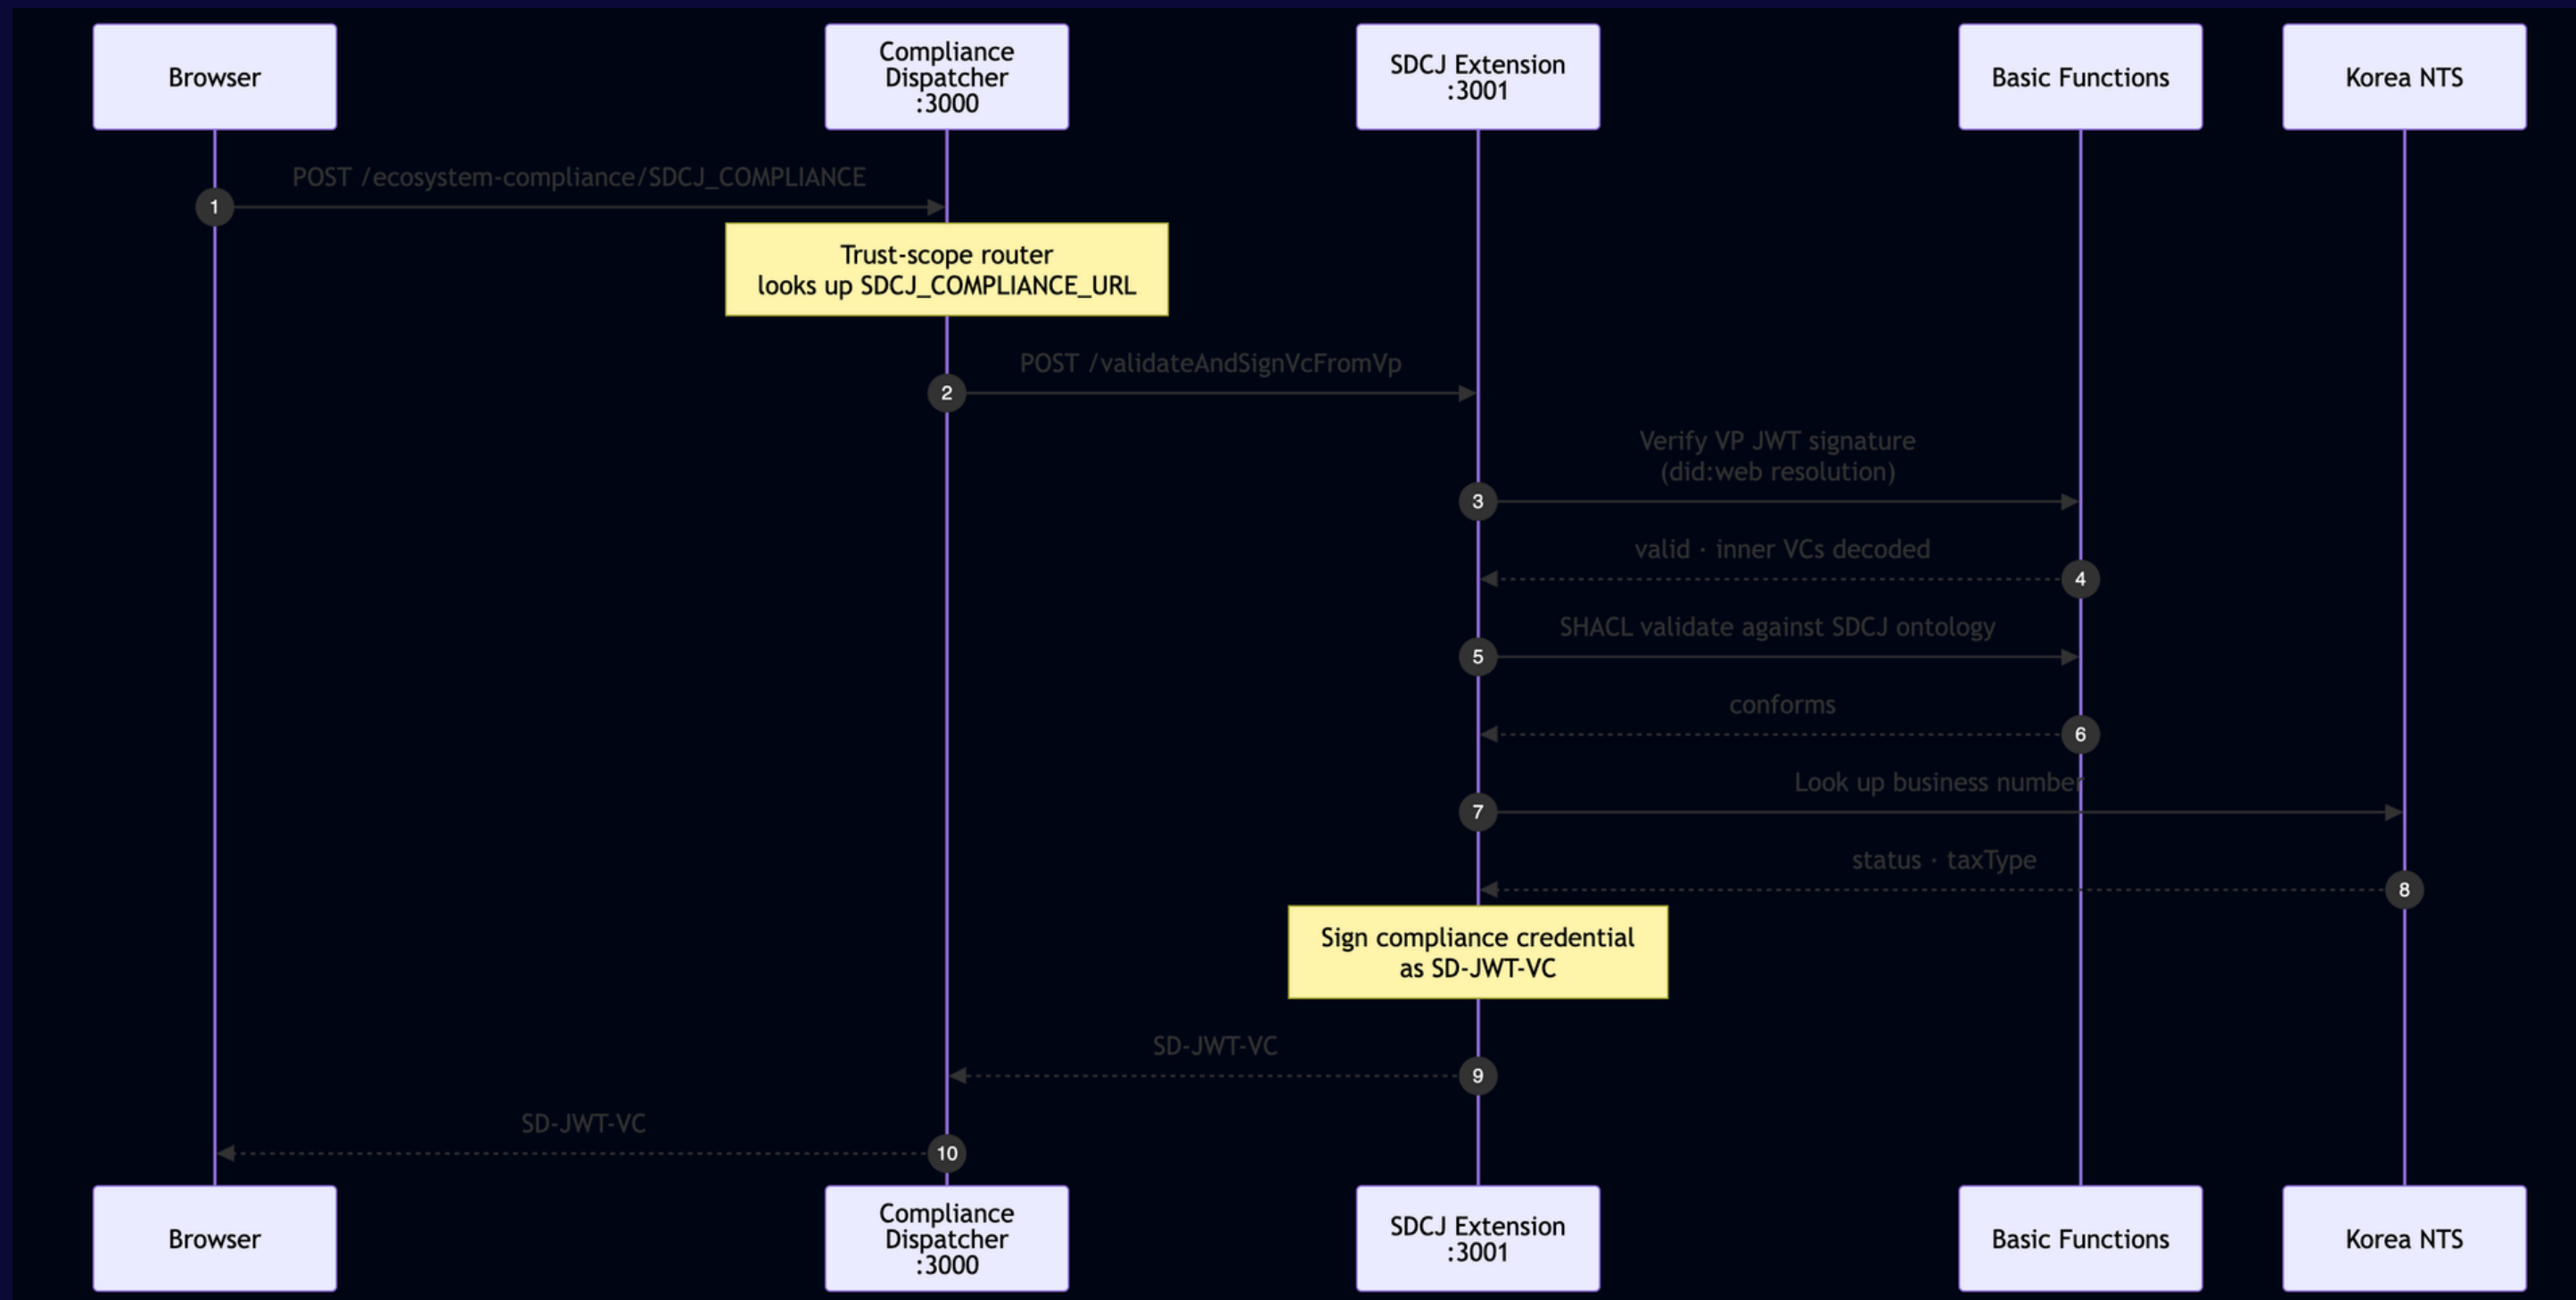

Plug & Play Jurisdiction

The background features a dark blue gradient with various light blue geometric patterns. In the corners, there are clusters of interconnected lines and dots, resembling circuit board traces or molecular structures. A thin horizontal line runs across the top and bottom of the page, centered under the main text.

Live Demo

End-to-End Through Gaia-X

Why this matters

- Cross-border B2B is exploding **KR, JP, EU** dataspace are real near-term traffic.
- Each jurisdiction has its own tax authority and its own data sensitivities.
- **SDCJ** means: one credential, multiple counterparties, minimum disclosure each time.
- Compliant by construction. No “I’ll send you a redacted PDF.”

What's next

- More jurisdictions (US EIN, SG UEN) same adapter pattern.
- [OID4VP](#) for wallet-to-verifier holder presentation
- Revocation lists ([SD-JWT](#) supports it). extension just needs to publish them

Thank you
